PERPETUAL MOTION AT LAST DISCOVERED.
SUPERCEDES AND ELIMINATES
ITS DISCOVERY ELIMINATES NUCLEAR ENERGY.

IT GIVES THE WORLD UNLIMITED NIAGARAS OF HEAT,
LIGHT AND POWER AT NO FUEL COST WHATSOEVER.
By Walter and Lao Russell.

We, the discoverers of perpetual motion, and inventors of THE RUSSELLS OPTICAL REACTOR, are pleased to announce to the world, and especially to those countries in it whose very existence is dependent upon securing oil from other countries, thet we have surmounted the presumably impossible feat of producing a machine which will give Niagaras of light, heat and power to motivate all industrial plants, all transportation, from railroads to automobiles on land and passenger and warships to motor craft on sea, all apartment buildings and hotels in cities and city streets, and all individual homes and farms the world over AT NO FUEL COST WHATSOEVER.

More especially are we pleased that it will transform the life and living conditions of all people living in the snow countries above the 40th parallel, such countries as Northern America, Canada, Norway, Sweeden, Finland, Russia, Siberia, China and Mongolia, by making it possible for them to grow unlimited quantities citrus and other fruits, roots and green vegetables, of both tropical and temperate zones, the year round in millions of mammoth double glassed green-houses, to give an abundant food supply to the worlds fast multiplying population by making available hundreds of millions of now unavailable acres of fertile virgin soil for that purpose.

THE RUSSELLS OPTICAL REACTOR WILL DO WITH SAFETY, AND AT NO FUEL COST, WHAT ANY NUCLEAR REACTOR DOES WITH GRAVE DANGER TO THE WHOLE HUMAN RACE, AND AT TREMENDOUS COST. Not only that but THE RUSSELLS REEACTOR can be scaled to an automobile or the greatest leviathan of the seas, while the nuclear reactor is usable only in large operations and is chained to just one location

We have proven the validity of our concept by making a simple small scale working model which is now supplying all the heat, light and power needed for our four story 52 room University. Our reactor generates much more power than needed for whatever purpose intended, so enough of that surplus is taken off from its generator to motivate the reactor in perpetuity.

Neuclear reactors need whole buildings for operation while ours occupies no more space than a furnace or oil heating plant to house its reactor, its steam-turbine and its generator. The nuclear reactor must be prevented from harming humans by building great concrete walls around it, while ours is perfectly harmless and occupies so little space that the one which operates at our headquartes occupies hardly more than six cubic feet, has no moving parts, and weighs not more than four hundred pounds, exclusive of its small steam turbine and generator.

It is needless to say that such a simple, mobile, light and power producing machine would not only effect the whole world-economy, but would be the first step in bringing abundance of the necessities for human existence to every nation on the face of this earth.

This is what God intended for mankind when he shall have arrived at that stage of his slowly awakening intelligence to realize the vast power which lies dormant in him <u>without even having the awareness that he has inherited such a vast power.</u> The only reason why man has not yet discovered this inherent power within him is because he does not realize that he is yet only in an early, barbaric stage of his unfolding and has yet a long way to go to reach those far stages, such as the rare few geniuses and still fewer cosmic conscious Illuminates who have far surpassed his present stage which Emerson described as but "the cock-crowing and morning star" of his evolution.

Man very mistakenly conceives himself as a finished creation, a "special creation of God." He has not yet learned that he was placed on earth to become God-like by manifesting God in the slowly growing awareness of his ONENESS with God. He is still far from realizing that God gave him a legacy of all knowledge and all power as his divine inheritance which must be slowly awakened during the countless millenia of his evolving. Not yet knowing that he already has all knowledge within him he still seeks it ouside of himself by the use of his body sensing. He has long since passed the stage of instinctive control by his Creator and has entered the stage of observation and deductive reasoning through his senses, together with a modicum of awareness of right from wrong, but that is a very early primitive stage, and for that reason, he has a very warped conception of what the universe, and its Creator, are like.

Two thousand years ago the greatest scientist of all time told his people that "knowledge could not be obtained by observation." The meaning behind those words is still a blank to the human race. Deductive reasoning from sensed observation of effects of motion is the very basis of scientific methods of securing knowledge. For that reason science is no nearer to comprehension of universal CAUSE today than it was 5000 years ago. Science has developed a mass of skills by thus observing effects of motion, but its attempt to solve CAUSE has but piled up a mass of ever-changing theories which are pure inventions, not one of which has as yet even touched the hem of the garment of Nature's TRUTHS. The senses of man are parts of the matter from which his body is made. These material senses cannot KNOW anything. They can but reflect the light of effects, as mirrors do, and they can remember and repeat them, but that is all that they can do except to assemble them in different patterns through what is known as deductive reasoning, but that is a function of the brain, and the brain is not the mind.

The great mass of humanity, with but a small percent of exceptions, has not yet begun the THINK and KNOW with their mind. Our very educational systems are beased upon remembering and repeating the observations and deductions of others. This is so conspicuous a fact that a child who really does think is apt to be classed as sub-normal, as such men as Edison and Whitman were thus judged.

For this reason all of present day cosmogenetic concepts are as unlike Nature as the flat world concepts of the ancients. Its very fundamentals, all of them, from the theory of the world's beginning to Newton's laws of gravity, from the present thermo-dynamic laws to the electromagnetic theory of light-waves, from the construction of the atom to the Coulomb law and from the expanding universe theory to the nature of light itself, have no resemblance to Nature whatsoever. In fact most of these fundamentals are the very opposite of present day belief.

© Science has yet to learn that there is but ONE THING in the universe, and that ONE THING is LIGHT. The electro-magnetic universe of man's concept has no existence. The science of LIGHT is OPTICS. When science knows the nature of light, and light-waves which extend from it to perform the work of Creation, it will then designate our Cosmos as an optical, photosynthetic, universe of gravity controlled light.

Science will remain in its infancy until it either makes that discovery or accepts it as the teachings of those who do know. Such evidences of that infancy as the belief that there are but two "magnetic poles" to a mass, or in a bar "magnet," instead of four pairs, and the total ignorance of the nature and purpose of our inert gases, or the four stage growth of electrons from cathode to anode, are but a few of the many which have not yet entered human consciousness, while practically all which have thus entered are cruelly misinterpreted. Conspicuous among these is the belief that matter attracts matter by a misconceived force called gravity, which

presumably pulls inward from within to compress invisible light into incandescent visibility. Deductive reasoning from observed effect did a lot of damage because of a falling apple. Long light-waves are shortened into visibility only through compression from without, as one would pump a tire. There is no inward pull in Nature, nor is their any mysterious "glue" which holds atoms together- nor is their a nucleus to the atom- nor is the atom a sphere. Atoms are rings with holes in them, caused by wave interferences, and the only spheres which occur in Nature are waves and amplitude elements, like carbon, and its prototype in flaming carbon suns. And even these spheres are composed of four pairs of light rings which synchronize with the light spectrum. More surprisingly still, the science of tomorrow will reveal the fact that all atoms which are generating toward their maturity are bi-convex lenses, and those which are radiating into their cold beginnings are bi-concave lenses. That is why the universe is an optical one.

Because of sense-based conclusions regarding the processes of Nature science does practically everything the hard way, the wasteful and costly way, and the dangerous way. Our planet is unnecessarily being robbed of its resources to leave a dead planet for future generations, its waters are being wasted, its forests depleted, its soils poisoned, its humans diseased, while billions are being spent for results which need but millions. Today we are talking about sending three men to the moon within ten years at a cost of forty billions of dollars, whereas it should be a simple matter to send twenty, or fifty, there andback under full control for low speed starting and returning, without need of high pressure projectors and parachute landings, at a cost not to exceed ten million dollars, plus the cost of the ship.

THE CREATOR'S INTENT FOR MAN.

For those who may marvel at the costless aspect of the method of obtaining light, heat and power we say to you that it is the Creator's intent that all of the necessities for either vegetable, animal or human

existence are to be given to all of His creations in abundance at only the cost of whatever service they give to the bodies which create them. That is all the Creator, Himself does. He services all things with the light of His Life and the waters of His spirit. The soil will give an abundance of nourishing food to any man who serves it with light and water, at no cost, and his own effort given with love. A billion dollars planted in the soil could not buy an ounce of food, while costless light, water and loving effort will yield countless tons.

And so it is with the air we breathe to sustain life, and the the light from the sun which unfolds all bodies from their seed and refolds them back again into their seed for endless repeticion. These, also, are costless. These, also, cannot be acquired for all the gold in the world unless God gives loving service to them from His infinite storehouse of omniscience and omnipotence.

(9) These are the ideas which mankind should open his consciousness to for the purpose of creating a happy and prosperous WORLD-HOME for all the races of men. Conversely, all ideas of missiles, armament, and desire to assert power over other men, should be eliminated from man's consciousness for these are the ideas of man which have made the world unhappy, fearsome and ugly.

LABORATORY DOORS ARE CLOSED TO GOD.

When science opens its laboratory doors to God, it will then transcend its present infancy, and not until. Because of closing God out science now does everything the hard, wasteful way, the costly way and the dangerous way. Our planet is unnecessarily being robbed of its resources for future generations, its waters are being polluted, its soils poisoned, its human bodies diseased and dust-bowls which born Saharas are being created because of forest destruction. These things are not necessay when one knows how to command matter. Unlimited metals can be obtained from silicon sand, and unlimited water from the atmosphere without desalting the ocean. An example of the millions which are being wasted is the present talk about sending three men to the moon within ten years at a cost of forty billion dollars, whereas it should be quite a simple task to send twenty or fifty men there and

see p 7

back under full control for low speed starting and returning, without need of high pressure projector or parachute landings, at a cost not to exceed ten million dollars above the price of the ship. This could be done within three to five years if present day science knew the real simple nature of the universe instead of its unreal very complex way.

The only reason why we have been able to give this extremely simple principle to the world is because the doors of our simple laboratory have always been wide open for God to enter in to work with us with our full moment to moment awareness of His Presence with us.

When present day man shall have passed through his barbaric, man-killing stage and unfolds into higher states of cosmic awareness of the unity of God and man, the great secrets of Creation, which are now closed to him, will gradually be revealed to him and he will make another world of supreme power and happiness for the entire human race. In the meantime we, who already know these secrets, will gradually give those to him which he can bear, and will not misuse, at this stage of his unfolding.

NEW CONCEPTS AND PRINCIPLES.

We are aware that the reader will be eager to know the basis upon which our very simple, costless, optical reactor is built. We will endeavor to state them sketchily and briefly in simple words. It is based upon one of the many ideas which have not yet come into human consciousness which we would like to give to the world if it will but listen to them. We have been ready to give this idea to the world for many years but it would not listen to them, so we had to become technicians to a sufficient state to demonstrate it to enforce its recognition as a new idea just born from its static condition in space to its dynamic expression in matter.

All ideas come into human awareness one by one, and as they come within man's consciousness his power multiplies in the measure of its import. The idea of electronics, or of radar, or atomic energy, had not entered within human awareness half a century ago, for example, but man's power increased in vast measure because of it.

This new power of perpetual motion and unlimited energy without fuel cost we have termed POWER MULTIPLICATION. By that we do not mean the multiplication of voltage by adding more voltage. We mean the self multiplication of a given amount of voltage to several hundred time that voltage as Nature does in every octave wave. Consider just one of them in a chemical example such as the carbon octave. It begins in the sub-zero inert gas with a sub-zero melting point. All up that octave each melting point and density multiplies in a step by step spectrum multiplication until the vast density of carbon is reached which has a melting point of 3600° centigrade. That is just one of many examples of Nature's way of generating the energy which creates our suns.

Science has recently discovered a new particle which exemplifies this principle. It is called a muon but resembles an electron except that its mass is 200 times greater, which science cannot account for. A greater knowledge of the principle of emergence of dynamic matter from static space would readily explain this phenomenon as we demonstrate in in our reactor. It is through our complete knowledge of the manner in which the dynamic universe of visible, incandescent light emerges from the static universe of the cold, invisible light of space by means of pulsing light waves that we are able to give to the world whatever of its secrets that this civilization of today is ready to receive. We say to you, however, that all of the secrets of Creation lie within the present unknown light waves which perform all of the work of Creation

Before we take the next step in explaining the science of our

power multiplication principle we desire to apply what we have written to our statement that science will forever close itself outside of the doors within which lie the great secrets of Creation until it opens its laboratory dorrs, and its heart, to let God in. The explanation of science for not letting God in is that God cannot be proved by laboratory methods. Let us concede that for the moment. And let us concede that any scientist does not believe in the existance of God, as a large part of the human world also does not believe in His existence, because there is no way of knowing God or of seeing Him. A certain cure for atheism, however, is knowledge of the nature of light.

It is not necessary that anyone does believe in God's existence. All one has to know, and to believe, is the existence of six things, namely; IDEA - INTELLIGENCE - LIGHT - LOVE - POWER, and LAW. Every one can believe that much for everyone has everyone of these qualities within himself. Everyone knows that the more idea he acquires, the greater is his power through increased measure of intelligence. Likewise, everyone can believe in the existence of dynamic light, for he can see it in suns and stars; and he can see it emerge from the invisible light of space and become dynamic by watching a meteorite turn into flame as it enters our atmosphere.

To us, however, these six qualities ARE GOD, and through the measure of our awareness of them in us God dwells within us - or, as the Nazarene expressed it; " I and my Father am ONE."

SCIENTIFIC EXPLANATION OF POWER MULTIPLICATION

To explain the scientific principle which underlies our discovery of perpetual motion, as demonstrated in our reactor, it is necessary to effectually invalidate one of the great fundamentsl concepts of present day science, the concept of thermodynamics, out of which belief has come the law of entropy, or heat death of the universe and the expanding universe. The present thermodynamic laws exclude the possibility of energy running "up hill". It can only run "down hill." That means that

science has not yet discovered any evidence that energy is being generated to equal that energy which is being radiated. This lack is also due to total ignorance of the nature of light and the light-waves which extend from it. The entire dynamic universe is a huge compression-expansion pump, and every wave is a lesser pump. Together these expansion-compression pumps constitute the heartbeat of the universe. Every physicist knows that it is impossible to create a pump which can only expand. Unless it can equally compress it could not operate.

Every wave pump is motivated photo-synthetically. Waves perform the work of Creation photo-synthetically. Trees grow from their seed that way. They are literally pumped into existence as the whole dynamic universe is similarly pumped into existence.

If the inner vision of a physicist could see the wave at work as cosmic Illuminates see it, they would see waves as spherical diaphragms of four concentric layers, each one opening and closing spirally, upon its centering static zero, and each one turing inside out and outside in to create the octave spectrum pressures which generate heat from cold and then radiate heat back again inti static cold.

Science, therefore, limits the universe to its

Sec p 11

~~the universe is not generating energy for it~~ science ~~has not discovered any evidence of that power. Science, therefore, limits the universe to its~~ one-way expression of power by radiating a source of energy which, in some remote past, appeared as a great ball of fire which is now splitting up into smaller balls of fire until, some, day, its heat will disappear into the vast cold of space. Science has no explanation for the appearance of that ball of fire, however, notwitstanding the fact that if it did appear it must have been generated from space, and space is cold.

It seems incredible that such a beliefe could be possible in view of the oft stated belief of many eminents scientists that "matter seems to emerge from space in some mysterious mannr, only to be again swallowed by space. These two beliefs are inconsistent with one another. The fact of Nature is that this universe is founded on balance in every respect. That which is radiated has first been generated. RADIATION is the REACTION of GENERATION. Science concedes that action and reaction are equal and opposite, but it does not state that the action must PRECEDE its reaction. In other words, heat could never radiate until it had first been generated.

Instead, therefore, of considering heat as the source of universal energy, let us look at it with eyes of inner vision instead of outer sensing and view heat as the product of cold. If matter emerges from space, and space is bitterly cold, heat must come from cold.

The process of that emergence is too long a story for here but our new laws of thermodynamics which will appear in due time in the advanced course of this University, will define the thermal cycle of the light spectrum. They are follows:

NEW LAWS OF THERMODYNAMIS.

First Law. Cold generates energy. Heat radiates energy. Cold multiplies. It cannot be divided. Heat divides. It cannot be multiplied.

Second Law. Every reaction must be preceded by its equal reaction.

Heat is the reaction of cold. Heat could not come into existence save for the compressive action of cold.

THIRD Third Law. Cold and heat express their opposition at angles of 90° from each other. Cold extends along wave axies of all bodies of creating matter where generative motion is minimum, while heat expansion is maximum at equatorial planes, where radiative motion is maximum.

Fourth Law. Cold compresses. Compression multiplies cold into heat. Heat expands. Expansion divides heat into cold. Cold and heat constitute the spectrum cycle as life and death, or the pulsing heartbeat of the dynamic universe constitute the wave cycle.

Fifth Law. When cold static light is divided into spectrum pairs, heat and motion are its created product. This entire universe is a varied measure of heat and motion. Heat and motion alone constitute the dynamic universe of matter. When heat begins, wave motion begins. Long low waves of low heat potential and high frequencies constitute the invisible light spectrum, while short high waves of high heat potential and low frequencies constitute the visible light spectrum

18/ Sixth Law. Universal energy is an attribute of the static, cold white light of space. There is no energy in the heat and motion which constitutes this material universe. That energy which appears to reside in matter is extended to it from its source in space to manifest the energy of its Creator, as the intelligence which appears to reside in marrionettes is extended to them from the intelligence of their creator.

Seventh Law. The emergence of heating matter in motion from the static cold of space begins at the indigo-blue and blue-violet ends of the spectrum and builds up through red and green, to the two white-centered yellows which parallel the equators of matter, until the equatorial plane of maximum heat is reactive at an angle of 90° from its static axis of minimum cold.

These laws demonstrate one of the most conspicuous laws of Nature which demands that every attribute of heat and motion in matter is divided into equal pairs, and that all thus created pairs must interchange, progressively, with each other through their whole spectrum journey to their maturity maximum, and back again to the zero of their beginning. This process constitutes Nature's growth cycles, which all creating matter must irrevocably pass through, repeatedly throughout eternity, to manifest the idea and purpose for which it is created. Through its belief in the expamding universe, science has condemned it to a heat death, known as the law of entropy. This includes all matter, organic and inorganic, mineral, vegetable and animal. The invisible light wave of the first three of Nature's nine octaves is sufficient to generate the invisible gases of matter but visible, dense matter can come into being only through the more compressed visible waves of the light spectrum.

FORECAST OF THE SCIENCE OF TOMORROW.

The human race is now due for a tremendous transition in both its physical and spiritual unfolding. New knowledge of the true nature of the universe can alone effect that transcendency into a higher stage of mans unfolding.

To our world-wide students the conspicuous fact that we have constantly repeated the fact that all the moving all of the secrets of the creation of our material universe lie in the levers of all of the wave. Strangely enough, however, all of the hidden TRUTH of the spiritual basis of our physical selves lies in the still fulcrum which motivates the levers of the wave.

(21)

When the human race comprehends this fact it will have gone far for it will then know that the prototype of that wave fulcrum IS CENTERED IN THE PINEAL GLAND OF HUMAN BEING and that it is the his creative intelligence which manifests his divine origin, as

source of
being the motovative/power of his body.

When mankind knows this the mystery of gravity will have then been
static
solved for him, for that/fulcrum which centers every wave of matter is GRAVITY- its very source of whatever power is extended to it through the wave levers which constitute its static axis.

GRAVITY controls the growth of every creating body in this universe for is the desire force in the mind of The Creator of it. As there is but ONE THING in this entire universe, and that one thing is LIGHT,-- and as all waves are extensions of divided light into spectrum pairs,--
bodies and particles of matter
and as all /are gravity centered light waves - every human on earth is centered and controlled by the power of gravity, whether he is willing to concede it to be a divine source or not. The light of God's omniscience centers every animal as instinct. It centers every human as knowledge, inspiration, intuition and other mental qualities which gradually lead him to masterliness in all achivements of man until he has reached their maximum of human power expression. Gravity is the one thing all creatures must obey even though their lessons may take many millions of repeated lives.

(22) Gravity performs the work of Creation by dividing the light of itself into spectrum pairs, then extending those pairs into spherical light waves of four divided sections to become the bases of its nine octaves of matter. This division creates the expansion stroke of the universal heartbeat. These octave waves then unite in what science calls "wave interferencees" to create lenses composed of diffraction rings which
reactive
refract into octave foci to create the/compression stroke which completes that heartbeat.

That divine spark of the mind and soul of man is in the pineal gland centers, and controls, every thought and
It also balances them.
action of his body. Man has free will control over his actions but the balancing power of gravity deprives him o'

him of all right to control the reaction to his action. For that cosmic reason, whatever any man does to hurt or bless another, he is doing to himself. He may reach high points and fall to low levels by defying that divine control which resides within himself. Whole civilizations may do likewise and find themselves in a mental dark for ages, as whole civilizations have fallen twenty times in but eight thousand years of their history, and as our present civilization is so very close to that we are counting the next fall of it, and the probable extermination of the whole white race, to come within ten years.

23 There will come a time, however, when a gradual increase of knowledge of Nature will have taught the human race that the qualities which constitute God are within man himself, and that he is ONE with his Creator. He will then have learned hard lessons of varied experiences and will have found them to be all GOOD, for all of them will have led to GOOD.

As man approaches this high state, he will become aware that his knowledge is not acquired by his brain, for the brain has no knowledge whatsoever. From the fulcrum center of whatever little or great knowledge he may have acquired since he arose from instinctive control, two wave levers reach out to the two lobes of his brain to communicate an awareness of his environment to his seat of sensation which his brain is. The gradual exaltation of man is caused by an ever increasing inner vision which slowly transcends his outer sensory vision.

GREAT NEED FOR MORE BASIC KNOWLEDGE.

We have cited the above for it is basic. One must first know his Soul-Self before he can even comprehend his universe enough to command it beyond his present primitive limitations. He must first learn how to obey Nature before he can command it. Knowledge of the true nature of the divided, dynamic universe, and its manner of emergence from the undivided static equilibrium, will alone give man

the omniscience and omnipotence of his cosmic inheritance.

Lao Russell founded this university for the specific purpose of giving our knowledge of the cosmic processes of Creation, and man's place in it, to all the world to teach man how to think inwardly toward the seat of his omniscience, as all geniuses and Illuminates do, instead of outwardly toward his senses as all but the small percentage of intellectuals continually do. Many among our intellectuals often have flashes of inspiration which leaves within them an idea which was not there one secod before, but they do not realize that they are receiving knowledge cosmically from the Source of all knowledge.

When our teachings of the secrets of this universe of LIGHT will have multiplied the world's genius thinkers to millions instead of hundreds, we planned that these few would be the seed which would leaven the whole of mankind and thus cause the human race to transcend its present barbaric, man-killing, self-first status.

The suicidal process of man, however, has so far advanced toward his harvest reaping time that there is no time for such a slow process. It is for that reason that we dicided to become technicians as well as teachers, and give this impoverished world a demonstration of the abundance man's Creator intended for him when he shall have arrived at that stage where he can bear to even hear the great truths of Creation.

This is our explanation of how we first gave light, heat and power to the world at no cost in money for that first necessity of present day man. Other necessities for our present unbalanced have-and-have not civilization, are (1) an abundant water supply transmuted from the atmosphere at any point desired, and in any quantities needed, without desalting and costly piping

(1) An abundant water supply

to inland cities through water meters which register the heavy costs of what should also be a costless necessity which every man could have in unlimited quantities at only the effort of his service to the machine which produced it.

Like our reactors, small machinescan be made for homes, farms, apartment houses and industries, while larger ones could be made for cities, or even for the reforestation of the world's many little and big Saharas.

(2) The next great need is for solar power. When this new power is given to the world, it will be possible to generate great Niagaras of power on our deserts and transmit it wirelessly by a new power which, likewise, has not yet entered the conceciousness of man. Nature has no need of wires or cables in the transmission of light, heat and power over countless trillions of miles of space. The radio and radar are steps in the direction of comprehending our omnipresent universe, but these sciences are also in their infancy.

(3) Man needs much more metal. Low grade ores are now worrying him. He also needs new metals. These can be given to him in unlimited quantities by transmuting them from silicon sand. Free hydrogen, ozygen and other fuels can also be transmitted this way. Transmutation is a simple process when one knows the nature of the light-wave pressures which constitute the wave and its atomic octaves, but it is an impossibility for any scientist of conventional training who does not know that secret.

As it is as easily possible to transmute gold from sand as it is copper or zinc, we will not in any way disclose that secret until man is ready to issue his currency based upon such human value as population and annual product total instead of upon gold. With new enlightenment that day should soon be here, however.

(4) The great new power to come is the principle known to be known as POWER PROJECTION. This principle will enable man to

accumulate power at any point upon the earth and project it to any other point on the earth or out in space upon any body - such as the moon, Mars or Venus upon which a focus can be refracted. Such a power could motivate industries or railroad trains, planes, automobiles or even space-craft and satellites which have been sent into orbit from this earth. Such a power could be so controlled that it could command as easy a launching from this earth, and as easy a re-entry, as a helicopter commands.

Another outstanding power which this principle would command is the power of identifying and destroying, by push button method, any war-ship, submarine, missile, arms plant or any other man-killing machine anywhere on the face of this earth or under its seas. Such a power would make it impossible for any ~~human~~ nation to attack any other nation, for even the smallest of nations could as easily protect itself from danger as the largest of nations.

With such a power at the command of all nations no nation would be unwise enought to try to hurt another. Again we say, however, that world abundance and the realization of the priceless asset every man on earth would be to every other man, the whole motive for war would be destroyed.

28/ We have named the great essentials. There are many others however, which would aid this civilization to so far transcend itself in the next generation as it would otherwise progress in three thousand years..

METHOD OF DISTRIBUTION FOR MUTUAL WORLD-BENEFIT.

Our first desire is to make this great boon tho mankind easily available to the whole world, for we are fully aware that it will immediately begin to enrich the whole world economy. For that reason we wish to lift it beyond the present low status of commercialism with its unfair practices, and into that spiritual realm of world unity

where exploitation and monopoly are impossible and patent protection is unnecessary. To make this reactor, and subsequent invention which will immediately follow it(~~if we have sufficient cooperation in human interest and a technical staff~~) a world owned property, shared by all nations for their peoples equally, it is necessary to transcend present day practices. It is even necessary to transcend present day man-made law by substituting the more inexorable laws of Nature.

It is a foundation stone of Natural law that he who gives service to the world of man, or to the soil of man's world, will unfailingly have equal service regiven to him. Commercially translated, that means that the labourer is worth his hire, or that he who wishes to obtain the property of another must regive in equal measure. 29

We teach, however, that all property of man must firt be obtained from the soil, for the planet God created is God's property, and in the final analysis one can obtain an abundance of the physical necessities for sustaining life only by serving God by being Co-Creator with Him in transformic the ideas locked up in the soil-body to becoming bodies which manifest the many ideas thus lock up in the soil.

This University teaches,also, that Nature's law of equal giving and re-giving, as so well exemplified by the interchange of rains from the heavens for the vapors of earth, must be as well balanced by man in his transactions as Nature balances them.

We have given this great Universal Law the name of RYTHMIC, BALANCED INTERCHANGE, and we impress upon our students that those three words are a sufficient basis for one to build his whole life and carreer upon.

Because of the import of the many things we have to give to bring abundance to man, ~~that~~ we desire to lift this transaction out of man's primitive trading practices to Nature's balanced interchanging practices.

For this reason this university could not give its discoveries to the world without following the law of balanced interchange, otherwise its fountains would dry up, and could not continue to spread its taechings into every nation and every race through branch extensions.

For this reason, we have not taken the usual steps to patent our reactor. To insure it's from being lost to the world by any act of Nature or man, we have taken the precaution to deposit blue prints of its structure in four places in the world, known only to a trusted group, until some action is taken by the world as a whole to adopt a plan of manufacture which will be equitable and mutually beneficial to all mankind.

The plan we suggest is to call a meeting of representatives of all nations and have them agree to purchase licencing rights jointly for the purpose of re-licensing these machines to manufacturers for tax revenue to each nation. The price each manufacturer will pay will be 10% of the gross, which follows the age-old tithing principle of biblical record.

Following this same principle, each licensed nation will pay to this university 1% of the gross, which will equal the 10% received by each nation.

Under patent laws, rights of ownership expire in time, and everybody then can own the property of another without giving equally for what they are taking. That is not equitable. There should never come a time when the creator of an idea of value could legally confiscate that creation without balancing it by equal interchange..

In this manner, nations may enrich their peoples and their own treasuries in perpetuity by a continual interchange of givings for re-givings, and the creator university can continue its world-wide work of giving new creations to the world as well as to spread its
